

Operator Run Sheet

What each control does, the order things have to happen in, and the one situation that will bite you if Director takes something while you're not looking.

01 CONTROL PANEL REFERENCE

ON-AIR ACTION GROUP

SEND TO PREVIEW

SAFE

Pushes the current layout to the **Engine's preview channel** only — nothing goes on air. Needs an element selected first (grey until then).

TAKE

ON AIR

Puts whatever is in the **Preview panel right now** on air. This is the only button that changes what viewers see.

OUT

ON AIR

Takes the current element back out. Needs an element selected — stays disabled otherwise.

CLEAN UP

DESTRUCTIVE

Wipes the **entire MSE playlist** server-side and clears every local selection. **Not undoable**. Never has a disabled state — it's always one click away.

HOUSEKEEPING GROUP

BACK

LOCAL ONLY

Undoes drag/delete edits, back to the layout as it last arrived. Never touches air — safe to press any time.

RELOAD PLAYLIST

LOCAL ONLY

Re-fetches the Data Element List from MSE. Doesn't touch what's on air or in Preview.

02 NORMAL FLOW

1

Pick an element

Click a thumbnail in the Data Element List. It loads into the Preview panel as the current **BASE** layout — nothing sent anywhere yet.

2

Relayout if needed **optional**

Drag a box onto another to swap cameras, or hit its × to remove it. Purely local — MSE

and Engine don't know about this until TAKE.

3

TAKE

Sends whichever layout is showing in Preview to air — the base layout, or your edited one if you relaid it out.

03 THE DIRECTOR RULE

▲ PREVIEW DOES NOT FOLLOW DIRECTOR

When Director takes something on its own, this app's Preview panel **keeps showing whatever you had selected before** — it does not jump to match what Director just put on air.

Pressing TAKE right now is still safe — it will correctly re-send to MSE rather than silently skipping it. But it takes **your own stale Preview** to air, overwriting Director's choice, which is probably not what you meant to do.

To work on what Director just took — click that element's thumbnail again in the Data Element List first. That's the only way this app learns the layout of what's now actually on air.

04 RULES THAT DON'T FIT A BUTTON

- **Can't delete the last box.** A layout always keeps at least one — the × hides itself once you're down to one.
- **3BOX_SP can't lose boxes.** It's arrangement-only — drag to swap cameras, but nothing can be deleted from it.
- **Double-click a box for Quick Zoom.** Stages a temporary single-box view of just that camera — SEND TO VIZ commits only the zoom, your main layout underneath is untouched.
- **Reload Playlist keeps your selection highlighted** if the same element is still in the refreshed list — you won't lose your place.

Input Sources and the large Preview / On Air boxes currently show placeholder test cards. not live camera feeds —
